

February 2007

Application: Compensate for different operator heights to increase efficiency.

Problem: Fixed platforms are not sufficient for both tall and short operators. This leads to over reaching and production inefficiencies.

Solution: **Production Operator lifts** fall into two categories; Lifts to compensate for the Operator's stature or height and Lifts to meet application elevation changes, required within each production cycle. Herkules incorporates our Direct Lifting - Air Bag Technology. This provides a low profile - stable lifting platform. Depending on the application parameters, we can provide you with a Fully Lowered Height of 4" or greater, Width of 40" or greater, Length to your specification, and Travel and/or Fully Raised Height to your specification.
